Learn Music Theory. net 2.4 Elementary Contrapuntal Motions

Contrapuntal comes from the word **counterpoint**, which means "note against note." **Contrapuntal motions** are the different ways two parts can relate when they move from one chord to the next.

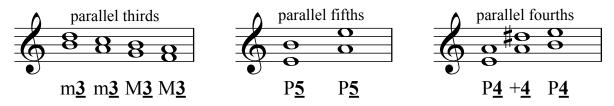

1. Static Motion

In *static motion*, both voices hold their notes. Static motion really means no motion at all.

2. Parallel Motion

In *parallel motion*, both voices move in the same direction and the interval class stays the same. The *quality* of the interval may be different (e.g. major vs. minor or perfect vs. diminished).

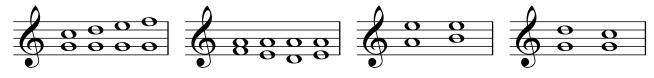

3. Contrary Motion

In contrary motion, one voice moves up and the other voice moves down. Both voices change pitches.

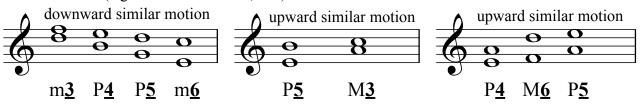

4. Oblique Motion

In *oblique motion*, one voice restates the same pitch while the other voice changes.

5. Similar Motion

In *similar motion*, both voices move in the same direction. Unlike parallel motion, the two intervals are different classes (e.g. seconds vs. thirds, etc.).
